PRODUCT DEFINITIONS

HYDRAULIC HOSE FITMENT

WARNING:

Hydraulic fluid under pressure can penetrate the skin or eyes and cause serious personal injury, blindness or death. Fluid leaks under pressure may not be visible. Use a piece of card or wood to find leaks. **DO NOT** use your bare hands. Wear safety goggles to protect your eyes. If any fluid is injected into the skin, it **MUST** be surgically removed. Seek immediate medical attention.

All Auger Torque Earth Drill Units require a 'flow' and 'return' of hydraulic oil from the parent machine's auxiliary hydraulic power supply to operate. The oil should be clean and free of contaminants such as water, dust and particulates. Auger Torque products require oil fluid cleanliness to meet or exceed: ISO Code 20/18/13 (ISO4406) to satisfy warranty requirements. All gearboxes are reversible, but require the host machine to be fitted with a two-way flow auxiliary circuit. (Check with parent machine dealer for advice).

When fitting hydraulic hoses, ensure that they are tightened to the correct torque for the hose fittings (Fig A).

Quick Release Couplers are required for connection to the parent machine, but may not be supplied with the unit. These can be sourced locally and should be compatible with the auxiliary hydraulic Quick Release Couplers on the parent machine (Figs B & C). The parent machine auxiliary hydraulic connections are normally located near the end of the loader arms, excavator dipper or truck crane booms.

Ensure that the drilling rotation of the Earth Drill Unit is clockwise.

It is critical that the supply of oil is within the stated flow & pressure limits for the particular Earth Drill;

Refer to the serial plate on the top of the Earth Drill hood (see page 4).

Case drain line fitting

Some of the larger Auger Torque Earth Drills are fitted with a case drain line.

This is a flexible hose protruding from the Earth Drill hood and must be connected to a line that returns to the machine's hydraulic fluid reservoir. The parts required to complete this circuit will vary, depending on the machine and the hydraulic equipment fitted. Consequently, case drain hose fittings are not supplied with the Earth Drill and must be sourced separately.

When fitting a case drain line, there must be no restrictions to the flow between the Earth Drill and the reservoir. You **MUST** not use quick release couplings.

You may receive an installation form with your unit, this form must be completed and returned to Auger Torque to validate the warranty.

EARTH DRILL MAINTENANCE

RUNNING-IN

To maximise the life of the unit, it must be run in for a period.

To carry out the running in procedure, suspend the Earth Drill in its vertical, working position.

For the duration of the running in procedure, ensure there are no bystanders within the nominated radius as defined in the risk assessment completed prior to commencing any works.

Operate the motor at 30% of rated pressure for 20 minutes in each direction before application of full operating load.

Service Intervals

Your Auger Torque Europe Ltd Earth Drill Unit features a sealed gear housing filled with gear oil to lubricate the planetary gearset components and bearings within the housing.

Auger Torque Europe Ltd Earth Drill Units are low maintenance, however regular checks for oil leaks and following the service schedules are recommended to ensure a trouble free product.

Weekly:

Grease hitch and Earth Drill pivot pins.

Oil Lubrication

Your Earth Drill has been prefilled with Gear Oil. This oil requires regular changing. Changing the oil at regular intervals will prolong the life of the unit.

Important

To maintain product warranty, your Auger Torque Dealer **MUST** record proof of each oil change.

Please have your Earth Drill serviced as specified in the chart overleaf by an **Authorised Auger Torque service representative**

Make sure that each service is documented in the Service Record section of this manual to ensure product warranty is retained and the product life is extended.

WEAR PART MAINTENANCE

Component Wear

The cutting teeth and pilots should be checked regularly for wear. The diagrams below show acceptable levels of wear.

NOTE: Excessively worn teeth & pilots may cause damage to the Auger

Cutting Tooth Maintenance

To cope with different types of trenching conditions, Auger Torque trenching chains are supplied fitted with interchangeable 'Earth' or 'Tungsten' teeth, or a combination of both types (Fig A).

The teeth are bolted directly to the chain, or with spacers to provide a range of trench widths.

After prolonged use, the cutting teeth will show signs of wear and eventually become inefficient.

Fig B shows acceptable levels of wear for the earth teeth.

Tungsten tooth wear limits are shown in Fig C.

RECOMMEND OIL CHANGE INTERVALS

Oil change frequency		
Model	First oil change after initial use	Subsequent oil change frequency
